FundBalance Receipt Scanning

A bar code scanning system is an essential tool for the streamlining of receipt data entry. Barcode scanning can save offices time, increase employee productivity, and reduce errors. But, offices need a system that is comprehensive, and easy to use and install.

Powerful Receipt Scanning

Tyler's FundBalance Receipt Scanning system is a powerful addition to the FundBalance software modules. Designed to streamline the data entry of receipts, FundBalance Receipt Scanning increases productivity, saves employee time, and reduces errors by quickly and accurately scanning invoices, utility bills, tax bills, and more.

Easy to use, the FundBalance Receipt Scanning system allows users to simply pass any form with a bar code under the scanning device's laser light for a quick and accurate read. Bar codes can be printed on any item users wish to receipt—when printing utility bills, invoices, or other forms, users simply select the option to include the bar code on the form. These forms should be returned with payments, allowing the receipt information to be scanned and “read” into the FundBalance software for processing. Data entry is reduced and accuracy is increased as corresponding account information is displayed each time a barcode is scanned.

FundBalance Receipt Scanning is fully integrated with all FundBalance modules. Cash receipts, utility bills, accounts receivable invoices, and even tax bills can all be scanned and imported into FundBalance Cash Receipts. This

information can then be transferred to the other FundBalance modules, including Accounts Receivable and Utility Billing. Accounts Receivable can read bar codes from invoices for quick receipting, and Utility Billing can read bar codes from utility bills, as well as past due or shut off notices. Plus, all modules can send bar code information to bar code capable printers.

Intelligent Technology

FundBalance Receipt Scanning makes it easy to take advantage of bar code scanning technology. Easy to use and simple to install by interfacing with each computer's Serial or USB port, this bar code scanning system includes a decoder box, cables, scanner programming, and a choice of input scanning devices—the laser gun, or the wand. An optional laser gun holder is available for hands-free operation. Each decoder is durable and comes with a two-year manufacturer's warranty.

Quick and easy to use, the scanner recognizes and reads Code 3 of 9 (Code 39) bar codes, and has extremely high first read rates. In addition, an audible beep indicates a successful scan, so users will always know which items have been scanned.

FundBalance Receipt Scanning is the essential tool for the streamlining of receipt data entry.
