

# MUNIS®

## APPLICATION DELIVERY

Tyler understands that what may work well for one client won't necessarily work for another. That's why we offer flexible deployment options for our MUNIS® solution. We want you to make decisions based on your organization's usage rather than adapting your organization to our offerings. This means there is no single best method for application delivery. Instead, you select according to the needs of your organization. It's that simple. Clients typically mix and match their deployment from the following options:

- Smart Client (Windows XP or higher, Mac OS X)
- ActiveX
- Internet Browsers (Internet Explorer 6 and Firefox 1.5)
- Thin Client (Terminal Services or Citrix)

### Smart Client

Smart Client offers the power and responsiveness of a traditional Windows application, in addition to tight integration with office productivity tools, such as Word® and Excel®.

- Users quickly and easily download data from the system to Excel
- Mail merge lets you merge data to produce form letters, e-mails, and custom reports
- Power users create templates that can be shared across your organization
- Upgrades and fixes are loaded on the MUNIS Server and automatically pushed to the workstation
- Suitable with LAN, WAN, wireless and VPN environments

### ActiveX

ActiveX offers the power of the Smart Client without the need for an initial install. Simply load the ActiveX package on a Web server and send the URL to all your MUNIS users.

- Users designate the URL as a Favorite
- ActiveX package checks the version to see if the user needs an upgrade. (If yes, the control facilitates the process, otherwise MUNIS launches.)

### MUNIS Web

This deployment option combines our XML-based architecture and robust business logic to provide a responsive AJAX interface. You can expose your applications to more users, moving the information closer to those who need it.

- Functionality is exposed to a Web server via the application server
- Application server takes the XML defining data and forms, and adds JavaScript to enforce business rules. The resulting Web page exchanges small amounts of data with the Web server behind the scenes, so the entire page is not reloaded each time a change is made.
- End result—a more responsive, easier-to-use interface

### Thin Client

If you have, or desire to have, a thin client strategy (Terminal Services or Citrix), MUNIS can easily fit into this environment. Many of our clients have implemented MUNIS with this method.

### Application Service Provider (ASP)

- Tyler hosts and manages your applications at our state-of-the-art data center
- Software is leased for a set fee
- We provide ongoing support, maintenance, and upgrades of the applications, hardware, and operating system

*Our open system approach benefits clients by enabling them to select the deployment options that best satisfy the unique needs of their organization. Isn't it time you reap the benefits of the MUNIS Financial Management system?*
